Summary of evaluation of Pfeifer DB-Anchor-System type Foot-Mounted anchor (cast-in anchor with internal threaded socket) under seismic actions according to ETAG 001, Annex E (Category C1)

Dear Mr. Neef,

company Pfeifer applies for the assessment of the DB-Anchor-System type Foot-Mounted anchor DB 682 for seismic applications (Category C1) according to ETAG 001, Annex E ([G2]). IEA was commissioned by company Pfeifer to assess the Foot-Mounted anchor DB 682 in an Evaluation Report ([G7]).

The Pfeifer DB Anchor System is a cast-in anchor system that has a European Technical Approval for static or quasi-static loading (ETA-11/0288; [G6]) for the sizes Rd12, Rd16, Rd20, Rd24 and Rd30 for use in uncracked and cracked concrete of strength classes C20/25 to C50/60.

For post-installed metal anchors (including undercut anchors) for use in concrete regulations for the assessment of seismic applications are defined in Annex E of ETAG 001 ([G2]). Therefore, in the report [G7] the required tests and the assessment are derived on the basis of [G2] due to the same load transfer mechanism (mechanical interlock). In [G7] the characteristic resistances for seismic Category C1 of [G2] for the Pfeifer Foot-Mounted anchor DB 682 are derived by theoretical considerations and tension tests at company Pfeifer with supervision of IEA.

In the evaluation it was shown that the characteristic resistances of the Pfeifer Foot-Mounted anchor DB 682 under tension loading for pullout and steel failure valid for static and quasi-static loading (ETA-11/0288; [G6]) are also recommended under seismic tension loading in Category C1 according to [G2] (factor $\alpha_{N,seis,C1} = 1,0$). The characteristic resistances and the corresponding material safety factors are summarized in Table 1 (pullout and concrete cone failure) and Table 2 (steel failure).

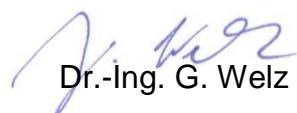

Under shear loading the seismic shear capacity for Category C1 for steel failure must be reduced. The characteristic seismic steel shear capacities for Category C1 and the corresponding material safety factors of the different anchor types and combination applied for are given in Table 3. They are valid for fastenings with single anchors.

The design of fastenings under seismic loading must be performed according to the ETAG Technical Report EOTA TR 45 [G4] or in the future according to the harmonized European Standard EN 1992-4 (see draft edition [G5]). The characteristic values given in Table 1 to Table 3 are to be used as values $R_{k,seis}^0$ according to [G4]. The regulations of TR 45 [G4] valid for Foot-Mounted anchors are given in the report [G2].

Kind regards

Dr.-Ing. J. Asmus

Dr.-Ing. G. Welz

Recommended characteristic values and partial safety factors:

Failure mode	Pullout failure		Concrete cone failure		
	Size	$N_{Rk,p,seis}(C20/25)$ kN	$\gamma_{Mp,seis}$ ²⁾ -	$N_{Rk,c,seis}(C20/25)$ ¹⁾ kN	$\gamma_{Mc,seis}$ ²⁾ -
Rd12	40	1,5	27,4	1,5	
Rd16	75		49,7		
Rd20	140		69,5		
Rd24	140		92,1		
Rd30	200		125,5		

1) Calculated according to [G5] with $N_{Rk,c} = 8,9 \cdot h_{ef}^{1,5} \cdot f_{ck,cyl}^{0,5}$

2) Partial material safety factors according to [G1] and [G4]

Table 1: Recommended characteristic resistances for pullout failure $N_{Rk,p,seis}$ and concrete cone failure $N_{Rk,c,seis}$ and material safety factors under seismic tension load for seismic Category C1 in cracked concrete C20/25 for Foot-Mounted anchor DB 682
